PRODUCT MONOGRAPH

INCLUDING PATIENT MEDICATION INFORMATION

RETEVMO™

Selpercatinib capsules

Capsules, 40 mg and 80 mg, oral

Protein Kinase Inhibitor

RETEVMO™, indicated as monotherapy for the treatment of:

- metastatic RET fusion-positive non-small cell lung cancer (NSCLC) in adult patients,
- RET-mutant medullary thyroid cancer in adult and pediatric patients 12 years of age and older with unresectable advanced or metastatic disease,
- RET fusion-positive differentiated thyroid carcinoma in adult patients with advanced or metastatic disease (not amenable to surgery or radioactive iodine therapy) following prior treatment with sorafenib and/or lenvatinib.

has been issued marketing authorization with conditions, pending the results of trials to verify its clinical benefit. Patients should be advised of the nature of the authorization. For further information for RETEVMO please refer to Health Canada’s Notice of Compliance with conditions - drug products web site (https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/notice-compliance/conditions.html).

Date of Initial Approval: JUN 11, 2021

Submission Control No: 243748

RETEVMO is a trademark owned by or licensed to Eli Lilly and Company, its subsidiaries or affiliates.
What is a Notice of Compliance with Conditions (NOC/c)?

An NOC/c is a form of market approval granted to a product on the basis of promising evidence of clinical effectiveness following review of the submission by Health Canada.

Products authorized under Health Canada's NOC/c policy are intended for the treatment, prevention or diagnosis of a serious, life-threatening or severely debilitating illness. They have demonstrated promising benefit, are of high quality and possess an acceptable safety profile based on a benefit/risk assessment. In addition, they either respond to a serious unmet medical need in Canada or have demonstrated a significant improvement in the benefit/risk profile over existing therapies. Health Canada has provided access to this product on the condition that sponsors carry out additional clinical trials to verify the anticipated benefit within an agreed upon time frame.

What will be different about this Product Monograph?

The following Product Monograph will contain boxed text at the beginning of each major section clearly stating the nature of the market authorization. Sections for which NOC/c status holds particular significance will be identified in the left margin by the symbol NOC/c. These sections may include, but are not limited to, the following:

- Indications;
- Action and Clinical Pharmacology;
- Warnings and Precautions;
- Adverse Reactions;
- Dosage and Administration; and
- Clinical Trials.

Adverse Drug Reaction Reporting and Re-Issuance of the Product Monograph

Health care providers are encouraged to report Adverse Drug Reactions associated with normal use of these and all drug products to Health Canada’s Canada Vigilance Program at 1-866-234-2345. The Product Monograph will be re-issued in the event of serious safety concerns previously unidentified or at such time as the sponsor provides the additional data in support of the product’s clinical benefit. Once the latter has occurred, and in accordance with the NOC/c policy, the conditions associated with market authorization will be removed.

PATIENT MEDICATION INFORMATION
RETEVMO™, indicated as monotherapy for the treatment of:

- metastatic RET fusion-positive non-small cell lung cancer (NSCLC) in adult patients,
- RET-mutant medullary thyroid cancer in adult and pediatric patients 12 years of age and older with unresectable advanced or metastatic disease,
- RET fusion-positive differentiated thyroid carcinoma in adult patients with advanced or metastatic disease (not amenable to surgery or radioactive iodine therapy) following prior treatment with sorafenib and/or lenvatinib.

has been issued marketing authorization with conditions, pending the results of trials to verify its clinical benefit. Patients should be advised of the nature of the authorization. For further information for RETEVMO please refer to Health Canada’s Notice of Compliance with conditions - drug products web site (https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/notice-compliance/conditions.html).

PART I: HEALTH PROFESSIONAL INFORMATION

1 INDICATIONS

RETEVMO (selpercatinib) is indicated as monotherapy for the treatment of:

- metastatic RET fusion-positive non-small cell lung cancer (NSCLC) in adult patients,
- RET-mutant medullary thyroid cancer (MTC) in adult and pediatric patients 12 years of age and older with unresectable advanced or metastatic disease,
- RET fusion-positive differentiated thyroid carcinoma in adult patients with advanced or metastatic disease (not amenable to surgery or radioactive iodine therapy) following prior treatment with sorafenib and/or lenvatinib.

Treatment with RETEVMO should only be initiated following confirmation of a RET gene fusion or mutation using a validated test (see CLINICAL TRIALS).

Promising clinical effectiveness of RETEVMO for the above indications is based on objective response rates (ORR) and duration of responses (DOR) from LIBRETTO-001, a multi-center, multi-cohort, open-label, Phase 1/2 trial in patients with specific genetic alterations in RET (see CLINICAL TRIALS).

1.1 Pediatrics

Pediatrics (12-17 years of age): Based on the data submitted and reviewed by Health Canada, the promising clinical effectiveness of RETEVMO have been established in adolescent patients 12-17 years of age with unresectable advanced or metastatic RET-mutant medullary thyroid cancer (see WARNINGS AND PRECAUTIONS: Special Populations – Pediatrics).

Pediatrics (<12 years of age): The safety and efficacy of RETEVMO in pediatric patients younger than 12 years of age have not been established (see WARNINGS AND PRECAUTIONS: Special Populations - Pediatrics).
1.2 Geriatrics

Geriatrics (≥65 years of age) Of the 702 patients in the safety database who received RETEVMO in LIBRETTO-001, 34% (239 patients) were ≥65 years of age and 10% (67 patients) were ≥75 years of age. No overall differences were observed in the safety or effectiveness of RETEVMO between patients who were ≥65 years of age and younger patients.

2 CONTRAINDICATIONS

RETEVMO is contraindicated in patients who are hypersensitive to this drug or to any ingredient in the formulation, including any non-medicinal ingredient or component of the container. For a complete listing, see DOSAGE FORMS, STRENGTHS, COMPOSITION AND PACKAGING.

3 SERIOUS WARNINGS AND PRECAUTIONS BOX

<table>
<thead>
<tr>
<th>Serious Warnings and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Embryo-Fetal toxicity (see WARNINGS AND PRECAUTIONS, Special Populations, Pregnant Women)</td>
</tr>
<tr>
<td>• Hemorrhage (see WARNINGS AND PRECAUTIONS, Hematologic)</td>
</tr>
<tr>
<td>• Hepatoxicity (see WARNINGS AND PRECAUTIONS, Hepatic/Biliary/Pancreatic)</td>
</tr>
<tr>
<td>• Hypersensitivity (see WARNINGS AND PRECAUTIONS, Immune)</td>
</tr>
<tr>
<td>• Hypertension (see WARNINGS AND PRECAUTIONS, Hypertension)</td>
</tr>
<tr>
<td>• QTc interval prolongation (see WARNINGS AND PRECAUTIONS, Cardiovascular and ACTION AND CLINICAL PHARMACOLOGY, Pharmacodynamics, Cardiac Electrophysiology)</td>
</tr>
</tbody>
</table>

RETEVMO should only be prescribed and supervised by a qualified health professional experienced in the use of anti-cancer agents.

4 DOSAGE AND ADMINISTRATION

4.1 Dosing Considerations

Confirm the presence of a RET gene fusion (for patients with NSCLC or thyroid cancer) or a RET gene mutation (for patients with MTC) using a validated test before starting treatment with RETEVMO.

Patient blood pressure is to be optimized before starting RETEVMO.

Reduce RETEVMO dose in patients with severe hepatic impairment (see DOSAGE AND ADMINISTRATION – Recommended Dose and Dosage Adjustment).

4.2 Recommended Dose and Dosage Adjustment

The recommended dosage of RETEVMO is based on body weight:

- Less than 50 kg: 120 mg twice daily
- 50 kg or greater: 160 mg twice daily
RETEVMO is administered orally approximately every 12 hours until disease progression or unacceptable toxicity.

Patients with severe hepatic impairment (Child-Pugh C) (less than 50 kg or 50 kg or greater) should receive a reduced dose of 80 mg twice daily (see ACTION AND CLINICAL PHARMACOLOGY—Special Populations).

Health Canada has not authorized an indication for use in children <12 years of age (see INDICATIONS).

4.3 Dose Modifications

Table 1 provides dose modifications for QT interval prolongation, increased aspartate aminotransferase (AST) or alanine aminotransferase (ALT), hypersensitivity, hypertension, hemorrhagic events and other Grade 3 or 4 adverse reactions.

The RETEVMO dosage recommendations per dose reduction level, for the management of these adverse reactions, are provided in Table 2. Permanently discontinue RETEVMO in patients unable to tolerate the third dose reduction level.

<table>
<thead>
<tr>
<th>Event</th>
<th>Grade*</th>
<th>Dose Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>QT Interval Prolongation</td>
<td>Grade 3</td>
<td>• Withhold RETEVMO until toxicity resolves to baseline or Grade 1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Resume RETEVMO at a reduced dose by 1 dose level.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Permanently discontinue if QT prolongation remains uncontrolled after 2 dose reductions.</td>

<tr>
<td></td>
<td>Grade 4 or if patient has signs or symptoms of serious arrhythmia</td>
<td>• Permanently discontinue RETEVMO.</td>
</tr>
<tr>
<td>AST/ALT Increase</td>
<td>Grade 3 and Grade 4</td>
<td>• Withhold RETEVMO and perform AST/ALT monitoring once weekly until resolution to Grade 1 or baseline.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Resume RETEVMO at a reduced dose by 2 dose levels and monitor AST/ALT once weekly.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• RETEVMO may be increased by 1 dose level after a minimum of 2 weeks without recurrence of increased AST/ALT.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Increase to dose taken prior to the onset of Grade 3 or 4 ALT/AST increase after a minimum of 4 weeks without recurrence. Continue AST/ALT monitoring once weekly for 4 weeks thereafter.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Permanently discontinue RETEVMO if recurrence of ≥Grade 3 toxicity despite dose reductions.</td>
</tr>
<tr>
<td>Hypersensitivity</td>
<td>All Grades</td>
<td>• Hold RETEVMO until toxicity resolves and begin steroid treatment.</td>
</tr>
</tbody>
</table>
Upon resolution of the event, resume RETEVMO at a reduced dose by 3 dose levels while continuing steroid treatment.

If after 1 week RETEVMO is tolerated without recurrent hypersensitivity, increase RETEVMO by 1 dose level weekly, ensuring that RETEVMO is tolerated for at least 1 week before proceeding to the next dose level.

Taper steroid dose after RETEVMO has been tolerated for at least 7 days at the final dose.

Permanently discontinue RETEVMO if recurrence of toxicity despite dose reductions.

Hold RETEVMO until hypertension is controlled with medical management.

When controlled, resume RETEVMO at next lower dose level.

Discontinue RETEVMO.

Withhold RETEVMO until recovery to baseline or Grade 0 or 1.

Discontinue RETEVMO for severe or life-threatening hemorrhagic events.

Withhold RETEVMO until recovery to baseline or Grade 0 or 1.

Resume at a reduced dose.

*Severity as defined by National Cancer Institute Common Terminology Criteria for Adverse Events (NCI CTCAE)

Dosage Modifications for Concomitant Use of Strong or Moderate CYP3A4 Inhibitors

Avoid concomitant use of strong or moderate CYP3A4 inhibitors with RETEVMO. If concomitant use of a strong or moderate CYP3A4 inhibitor cannot be avoided, reduce the current RETEVMO dose as recommended in Table 3 and monitor the QTc interval more frequently with ECGs. After the inhibitor has been discontinued for 3 to 5 elimination half-lives of the inhibitor, resume RETEVMO at the dose taken before starting the CYP3A4 inhibitor (see DRUG INTERACTIONS – Drug-Drug Interactions and ACTION AND CLINICAL PHARMACOLOGY – Pharmacokinetics).
Table 3 - Recommended RETEVMO Dosage for Concomitant Use of Strong or Moderate CYP3A Inhibitors

<td>80 mg orally twice daily</td>
<td></td>
</tr>
</tbody>
</table>

There is no data on the safety of concomitant use of CYP3A inhibitors in patients whose RETEVMO dose was previously reduced due to adverse reactions.

**Dosage Modifications for Concomitant Use of Acid-Reducing Agents**

Avoid concomitant use of a proton pump inhibitor, a histamine-2 (H2) receptor antagonist, or a locally acting antacid with RETEVMO (see DRUG INTERACTIONS – Drug-Drug Interactions). If concomitant use cannot be avoided,

- RETEVMO should be taken with food when co-administered with a proton pump inhibitor.
- RETEVMO should be taken 2 hours before or 10 hours after administration of an H2 receptor antagonist.
- RETEVMO should be taken 2 hours before or 2 hours after administration of a locally acting antacid.

**4.4 Administration**

RETEVMO can be taken with or without food unless coadministered with a proton pump inhibitor (see DOSAGE AND ADMINISTRATION – Dose Modifications).

Patients should swallow the capsules whole and should not open, crush, or chew the capsule.

**4.5 Missed Dose**

If the patient misses a dose of RETEVMO, the patient should take the next dose at the next scheduled time, unless it is more than 6 hours until the next scheduled dose.

If the patient vomits after taking a dose of RETEVMO, the patient should not take an additional dose. The patient should take the next dose at the next scheduled time. The patient should not take 2 doses at the same time to make up for the missed dose.

**5 OVERDOSAGE**

There is no known antidote for RETEVMO. The treatment of overdose of RETEVMO should consist of general supportive measures. ECG monitoring is recommended.

For management of a suspected drug overdose, contact your regional poison control centre.

RETEVMO (selpercatinib) is supplied as grey (40 mg) and blue (80 mg) hard capsules.

The 40 mg capsules are grey opaque hard gelatin capsules (size 2) with black printing of “Lilly 3977” and “40 mg” on the body of the capsule. They are supplied in 75 mL bottles of 60 capsules.

The 80 mg capsules are blue opaque hard gelatin capsules (size 0) with black printing of “Lilly 2980” and “80 mg” on the body of the capsule. They are supplied in 125 mL bottles of 60 capsules and 190 mL bottles of 120 capsules.

7 WARNINGS AND PRECAUTIONS

Cardiovascular

QTc Interval Prolongation: RETEVMO causes concentration-dependent QTc interval prolongation (see ADVERSE REACTIONS, Electrocardiograms). QTc interval prolongation can lead to an increased risk of ventricular arrhythmias including torsade de pointes. The use of RETEVMO should be avoided in patients with conditions that may increase the risk of experiencing torsade de pointes.

Torsade de pointes is a polymorphic ventricular tachyarrhythmia. Generally, the risk of torsade de pointes increases with the magnitude of QTc prolongation produced by the drug. If sustained, torsade de pointes can progress to ventricular fibrillation and sudden cardiac death.

Risk factors for torsade de pointes in the general population include, but are not limited to, the following: female gender, age ≥65 years, baseline prolongation of the QTc interval, presence of genetic variants affecting cardiac ion channels or regulatory proteins (especially congenital long QT syndromes), family history of sudden cardiac death at <50 years of age, cardiac disease (e.g., myocardial ischemia or infarction, congestive heart failure, cardiomyopathy, conduction system disease), history of arrhythmias, electrolyte disturbances (e.g., hypokalemia, hypomagnesemia, hypocalcemia), conditions leading to electrolyte disturbances (e.g., persistent vomiting, eating disorders), bradycardia, acute neurological events (e.g., intracranial or subarachnoid hemorrhage, stroke, intracranial trauma), diabetes mellitus, and autonomic neuropathy.

Combination use of RETEVMO with other drugs known to prolong the QTc interval and/or strong or moderate CYP3A inhibitors should be avoided, as this may lead to further prolongation of the QTc interval. Use caution if RETEVMO is administered in combination with agents known to cause bradycardia (e.g., beta-blockers, non-dihydropyridine calcium channel blockers, clonidine, and digoxin) or drugs that can decrease electrolytes (see DRUG INTERACTIONS). Monitor the QTc interval more frequently in these patients (see WARNINGS AND PRECAUTIONS - Monitoring and Laboratory Tests).
Patients must have a QTcF interval of ≤470 ms and serum electrolytes within normal range before starting RETEVMO treatment. Perform electrocardiograms and measure serum electrolytes before starting RETEVMO treatment and during treatment. Treatment with RETEVMO should be avoided in patients with uncorrected hypokalemia, hypomagnesemia, or hypocalcemia (see WARNINGS AND PRECAUTIONS - Monitoring and Laboratory Tests).

Interruption and dose reduction or permanent discontinuation of RETEVMO may be required based on the severity of QTc interval prolongation (see DOSAGE AND ADMINISTRATION – Dose Modifications).

**Hypertension**: Hypertension occurred in 35% of patients in LIBRETTO-001, including Grade 3 or 4 hypertension in 18% of patients (see ADVERSE REACTIONS). Treatment-emergent hypertension was most commonly managed through concomitant anti-hypertension medications.

Patient blood pressure is to be optimized before starting RETEVMO. Monitor blood pressure during RETEVMO treatment. Based on the level of increased blood pressure, RETEVMO may require dose modification (see DOSAGE AND ADMINISTRATION – Dose Modifications). Permanently discontinue RETEVMO if medically significant hypertension cannot be controlled with antihypertensive therapy.

**Driving and Operating Machinery**
RET_EVMO may influence the ability to drive and use machines. Patients should be advised to be cautious when driving or using machines in case they experience fatigue or dizziness during treatment with RETEVMO.

**Hematologic**
Serious, including fatal, hemorrhagic events can occur with RETEVMO. Grade ≥3 hemorrhagic events occurred in 2.3% of patients treated with RETEVMO, including 3 (0.4%) patients with fatal hemorrhagic events, including one case each of cerebral hemorrhage, tracheostomy site hemorrhage, and hemoptysis.

Permanently discontinue RETEVMO in patients with severe or life-threatening hemorrhage.

**Hepatic/Biliary/Pancreatic**
Serious hepatic adverse reactions occurred in 2.7% of patients treated with RETEVMO in the LIBRETTO-001 study (see ADVERSE REACTIONS). Increased AST occurred in 51% of patients, including Grade 3 or 4 events in 8%. Increased ALT occurred in 45% of patients, including Grade 3 or 4 events in 9%. The median time to first onset for increased AST was 4.1 weeks (range: 5 days to 2 years) and for increased ALT, it was 4.1 weeks (range: 6 days to 1.5 years).

Monitor ALT and AST before starting RETEVMO, every 2 weeks during the first 3 months of treatment, then monthly thereafter and as clinically indicated. Withhold, reduce dose, or permanently discontinue RETEVMO based on the severity of ALT/AST increase (see DOSAGE AND ADMINISTRATION – Dose Modifications and ADVERSE REACTIONS).

**Immune**
Hypersensitivity occurred in 4.3% of patients receiving RETEVMO, including Grade 3 hypersensitivity in 1.6%. The median time to onset was 1.7 weeks (range: 6 days to 1.5 years). Signs and symptoms of hypersensitivity included fever, rash, and arthralgias or myalgias with concurrent decreased platelets or AST/ALT increase.

If hypersensitivity occurs, withhold RETEVMO until toxicity resolves and begin steroid treatment. Upon resolution of the event, resume RETEVMO at a reduced dose by 3 dose levels for 1 week. If tolerated without recurrent hypersensitivity, increase RETEVMO by 1 dose level weekly.
Continue steroid treatment until the target dose is reached and then taper (see DOSAGE AND ADMINISTRATION – Dose Modifications). Permanently discontinue RETEVMO if toxicity recurs despite dose reductions.

**Impaired Wound Healing**

Impaired wound healing can occur in patients who receive drugs that inhibit the vascular endothelial growth factor (VEGF) signaling pathway. Therefore, RETEVMO has the potential to adversely affect wound healing.

Withhold RETEVMO for at least 7 days prior to elective surgery. Do not administer for at least 2 weeks following major surgery and until adequate wound healing. The safety of resumption of RETEVMO after resolution of wound healing complications has not been established.

**Monitoring and Laboratory Tests**

Perform electrocardiograms and measure serum electrolytes before starting RETEVMO treatment. Ensure a QTcF interval of ≤470 ms before starting RETEVMO treatment. Hypokalemia, hypomagnesemia, and hypocalcemia should be corrected prior to initiation or continuation of RETEVMO treatment. Monitor electrocardiograms and serum electrolytes in all patients after 1 week of RETEVMO treatment, at least monthly for the first 6 months of RETEVMO treatment, and otherwise as clinically indicated. Monitor the QTc interval more frequently in patients who are at an increased risk of torsade de pointes (see WARNINGS AND PRECAUTIONS – QTc Interval Prolongation). Monitor the QTc interval more frequently if RETEVMO is concomitantly administered with strong or moderate CYP3A inhibitors or drugs known to prolong the QTc interval (see DRUG INTERACTIONS).

Control hypertension before starting RETEVMO. Monitor blood pressure after 1 week of starting therapy, monthly for 6 months, and as clinically indicated (see DOSAGE AND ADMINISTRATION – Dosing Considerations).

Monitor ALT and AST before starting RETEVMO, every 2 weeks during the first 3 months of treatment, then monthly thereafter and as clinically indicated (see DOSAGE AND ADMINISTRATION – Dose Modifications).

**Sexual Health**

**Reproduction:** Women of childbearing potential must be advised to avoid becoming pregnant while receiving RETEVMO.

Advise females of reproductive potential to use highly effective contraception during treatment with RETEVMO and for at least 2 weeks after the last dose.

Verify negative pregnancy status in women of reproductive potential before starting RETEVMO.

Advise men with female partners with reproductive potential to use effective contraception during treatment and for at least 2 weeks after the last dose of RETEVMO (see NON-CLINICAL TOXICOLOGY - Reproductive and Developmental Toxicology).

**Fertility:** RETEVMO may impair fertility in men and women of reproductive potential (see NON-CLINICAL TOXICOLOGY - Reproductive and Developmental Toxicology).

**Tumor Lysis Syndrome**

Tumor lysis syndrome (TLS) occurred in 1% of patients with medullary thyroid carcinoma receiving RETEVMO. Patients may be at risk of TLS if they have rapidly growing tumors, a high tumor burden, renal dysfunction, or dehydration. Closely monitor patients at risk, consider appropriate prophylaxis including hydration, and treat as clinically indicated.
7.1 Special Populations

7.1.1 Pregnant Women
RETEVMO should not be used during pregnancy. Based on findings in animals and its mechanism of action, RETEVMO can cause fetal harm when administered to a pregnant woman. In an embryo-fetal development study in rats during organogenesis, selpercatinib was teratogenic and caused embryolethality and malformations at maternal exposures that were approximately equal to the exposure of the recommended human dose (AUC) (see NON-CLINICAL TOXICOLOGY – Reproductive Toxicology).

7.1.2 Breast-Feeding
There are no data on the presence of selpercatinib in human milk, effects of selpercatinib on the breastfed child, or the effects of selpercatinib on milk production. Because of the potential for serious adverse reactions in breastfed children, advise a nursing woman to discontinue breastfeeding during RETEVMO treatment and for at least 2 weeks after the last dose of RETEVMO.

7.1.3 Pediatrics (<18 years of age)
In the LIBRETTO-001 study, there were no adolescent patients with RET fusion-positive thyroid cancer and only 3 adolescent patients (15, 16 and 17 years of age) with advanced or metastatic RET-mutant medullary thyroid cancer. No unexpected safety findings were observed in these pediatric patients compared to the adult population.

RETEVMO is associated with a potential risk for delayed growth. In non-clinical studies, animals showed signs of physeal hypertrophy and tooth dysplasia at doses resulting in exposures of approximately 3 times (for rats) and approximately 0.3 times (for minipigs) the human exposure at the 160 mg twice daily clinical dose (see NON-CLINICAL TOXICOLOGY). Monitor growth plates in adolescent patients with open growth plates. Consider interrupting or discontinuing therapy based on the severity of any growth plate abnormalities and based on an individual risk-benefit assessment.

RETEVMO may impair fertility in adolescents of reproductive potential. (see NON-CLINICAL TOXICOLOGY – Reproductive Toxicology).

The safety of long-term use of RETEVMO in adolescent patients has not been evaluated.

The safety and efficacy of RETEVMO in patients under the age of 12 has not been established.

Reduce the RETEVMO dose in adolescent patients <50 kg (see DOSAGE AND ADMINISTRATION) and monitor the QTc interval more frequently with ECGs.

7.1.4 Patients with Hepatic Impairment
Limited safety data are available for the use of RETEVMO in patients with severe hepatic impairment. Patients with severe hepatic impairment should receive a reduced dose of RETEVMO (see DOSAGE AND ADMINISTRATION) and monitor ALT and AST more frequently as clinically indicated.

7.1.5 Patients with Renal Impairment
The use of RETEVMO in patients with end-stage renal disease is not recommended (see ACTION AND CLINICAL PHARMACOLOGY– Special Populations and Conditions).
8 ADVERSE REACTIONS

8.1 Adverse Reaction Overview

The most commonly reported adverse reactions, including laboratory abnormalities (≥25%), in order of decreasing frequency were: increased AST, increased ALT, lymphocyte count decreased, glucose increased, leukocytes decreased, albumin decreased, calcium decreased, dry mouth, creatinine increased, diarrhea, alkaline phosphatase increased, hypertension, platelets decreased, total cholesterol increased, fatigue, rash, sodium decreased and constipation.

Serious adverse events occurred in 33% of patients who received RETEVMO. The most frequent serious adverse events (in ≥2% of patients) were pneumonia and hemorrhage (see Table 5, footnote c for list of terms that contributed to the hemorrhage composite term).

Deaths due to an adverse event occurred in 3% of patients; events that occurred in >1 patient included sepsis (n=3), cardiac arrest (n=3), respiratory failure (n=3), and hemorrhage (n=3).

Permanent discontinuation due to an adverse event occurred in 5% of patients who received RETEVMO. Adverse events resulting in permanent discontinuation included: increased ALT (0.4%), sepsis (0.4%), increased AST (0.3%), drug hypersensitivity (0.3%), fatigue (0.3%), and thrombocytopenia (0.3%).

Dosage interruptions due to an adverse event occurred in 42% of patients who received RETEVMO. Adverse events requiring dosage interruption in >2% of patients included: ALT increased, AST increased, hypertension, diarrhea, pyrexia, and QT prolongation.

Dose reductions due to an adverse event occurred in 31% of patients who received RETEVMO. Adverse events requiring dosage reductions in >2% of patients included: ALT increased, AST increased, QT prolongation, and fatigue.

8.2 Clinical Trial Adverse Reactions

Because clinical trials are conducted under very specific conditions, the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.

The safety of RETEVMO has been assessed in 702 patients from an open-label, multi-center, multi-cohort, single-arm, phase 1/2 study (LIBRETTO-001). The median age was 59 years (range: 15 to 92 years); 0.4% were pediatric patients less than 18 years of age; 52% were male; and 69% were White, 22% were Asian, 5% were Hispanic/Latino, and 3% were Black. ECOG performance status was 0-1 (95%) or 2 (5%). Patients with hepatic, renal or cardiac impairment (including prolonged QT syndrome) at baseline were not included in LIBRETTO-001. Most patients had metastatic RET-altered solid tumors, including RET fusion-positive non-small cell lung cancer (n=329); RET-mutant medullary thyroid cancer (n=299) and RET fusion-positive advanced thyroid cancer (n=37). RETEVMO was evaluated as a single agent at 160 mg orally twice daily. Ninety-five percent (95%) of patients received at least one dose of RETEVMO at the recommended dosage of 160 mg orally twice daily. Patients received RETEVMO for a median duration of 8.7 months (range: 0.1-31.0 months).

Treatment-emergent adverse events reported in ≥10% of patients treated with RETEVMO in LIBRETTO-001 are listed in Table 5.

**8.3 Less Common Clinical Trial Adverse Reactions**

Additional less common treatment-emergent adverse events (all grades) occurring at an overall incidence <10% and ≥1% of patients included:

**Blood and lymphatic system disorders:** anemia, neutropenia.

**Cardiac disorders:** atrial fibrillation, bradycardia, palpitations, pericardial effusion, sinus bradycardia, sinus tachycardia, tachycardia.

**Ear and labyrinth disorders:** tinnitus, vertigo.

**Endocrine disorders:** hyperthyroidism, hypothyroidism.
Eye disorders: dry eye, vision blurred.

Gastrointestinal disorders: abdominal distension, ascites, colitis, dysphagia, dyspepsia, enteritis, flatulence, gastritis, gastroesophageal reflux disease, mouth ulceration, stomatitis.

General disorders and administration site conditions: chest discomfort, chest pain, chills, gait disturbance, influenza-like illness, non-cardiac chest pain, mucosal inflammation, pain.

Hepatobiliary disorders: hyperbilirubinemia.

Immune system disorders: hypersensitivity, seasonal allergy.

Infections and infestations: bronchitis, conjunctivitis, diverticulitis, gastroenteritis, lung infection, nasopharyngitis, oral candidiasis, paronychia, pharyngitis, pneumonia, sepsis, sinusitis, skin infection, tooth infection, upper respiratory tract infection.

Injury, poisoning and procedural complications: fall.

Investigations: blood alkaline phosphatase increased, blood bilirubin increased, blood cholesterol increased, blood creatinine increased, blood lactate dehydrogenase increased, blood magnesium decreased, blood phosphorus increased, blood pressure increased, blood thyroid stimulating hormone increased, gamma-glutamyltransferase increased, lipase increased, liver function test increased, protein total decreased, weight decreased, weight increased, transaminases increased.

Metabolism and nutrition disorders: dehydration, hypercalcemia, hypercholesterolemia, hyperglycemia, hyperkalemia, hypernatremia, hyperuricemia, hypoalbuminemia, hypocalcemia, hypoglycemia, hypokalemia, hypomagnesemia, hyponatremia, hypophosphatemia, vitamin D deficiency.

Musculoskeletal and connective tissue disorders: bone pain, flank pain, muscle spasms, muscular weakness, musculoskeletal chest pain, musculoskeletal stiffness, myalgia, neck pain, pain in extremity.

Nervous system disorders: amnesia, disturbance in attention, dysgeusia, hypoesthesia, memory impairment, neuropathy peripheral, paresthesia, peripheral sensory neuropathy, presyncope, seizure, syncope, tremor.

Psychiatric disorders: anxiety, confusional state, delirium, depression, insomnia, libido decreased.

Renal and urinary disorders: acute kidney injury, dysuria, micturition urgency, pollakiuria, proteinuria, renal failure, urinary incontinence, urinary retention.

Reproductive system and breast disorders: erectile dysfunction.

Respiratory, thoracic and mediastinal disorders: dysphonia, hypoxia, nasal congestion, nasal dryness, oropharyngeal pain, pleural effusion, pneumonitis, pulmonary embolism, respiratory failure, rhinitis allergic, sinus congestion, upper-airway cough syndrome.

Skin and subcutaneous tissue disorders: acne, alopecia, dermatitis acneiform, eczema, erythema, hyperhidrosis, night sweats, palmar-plantar erythrodynesthesia syndrome, photosensitivity reaction, pruritus, skin exfoliation, skin lesion, skin ulcer.

Vascular disorders: embolism, flushing, hot flush, hypotension.
### 8.4 Abnormal Laboratory Findings: Hematologic, Clinical Chemistry and Other Quantitative Data

The following table (Table 6) provides treatment-emergent shifts from baseline in laboratory abnormalities occurring in patients treated with RETEVMO in the LIBRETTO-001 study.

<sup>a</sup> Denominator for each laboratory parameter is based on the number of patients with a baseline and post-treatment laboratory value available, which ranged from 670 to 692 patients.

<sup>b</sup> The severity of TEAEs was graded based on the National Cancer Institute-Common Terminology Criteria for Adverse Events (NCI-CTCAE) v 4.03, except for increased creatinine, which was based on v5.0.

**Electrocardiograms:** QTc interval prolongation was reported in patients receiving RETEVMO in clinical trials. In the LIBRETTO-001 trial, the mean change from baseline QTcF averaged 18-22 ms at 2 h post-dosing from day 8 of treatment onward in patients initiated at the 160 mg
twice daily dose of RETEVMO. Treatment-emergent QTcF values >480 ms and >500 ms were reported in 16.9% and 6.1% of patients, respectively. QTcF increases from baseline >60 ms were reported in 15.4% of patients (see WARNINGS AND PRECAUTIONS, and ACTION AND CLINICAL PHARMACOLOGY, Cardiac Electrophysiology).

Treatment with selpercatinib 160 mg BID was also associated with decreases from baseline in heart rate that averaged about -5 bpm to -9 bpm and increases from baseline in the PR interval that averaged about 5 ms to 9 ms from day 8 onward at 2 h post-dosing.

9 DRUG INTERACTIONS

9.1 Overview

Selpercatinib is a substrate of CYP3A4 and it is predominantly metabolized by CYP3A4.

Coadministration of RETEVMO with a moderate or strong CYP3A4 inhibitor may increase selpercatinib plasma concentrations, which may increase the risk of adverse reactions related to RETEVMO, including QTc interval prolongation.

Coadministration of RETEVMO with a moderate or strong CYP3A4 inducer may decrease selpercatinib plasma concentrations.

Coadministration of RETEVMO with CYP3A4-sensitive substrates may increase plasma concentrations of the CYP3A4 substrates. Coadministration of RETEVMO with sensitive CYP2C8 substrates may increase plasma concentrations of the CYP2C8 substrates.

Selpercatinib inhibits the renal transporter multidrug and toxin extrusion protein 1 (MATE1). In vivo interactions of selpercatinib with clinically relevant substrates of MATE1, such as creatinine, may occur. RETEVMO may increase serum creatinine due to inhibition of the renal tubular secretion transporter MATE1, without affecting glomerular function.

Selpercatinib is an in vitro substrate and inhibitor of P-glycoprotein (P-gp) and Breast Cancer Resistance Protein (BCRP), but the clinical relevance of this finding has not been evaluated.

Concomitant use of RETEVMO with acid-reducing agents may decrease selpercatinib plasma concentrations, which may reduce RETEVMO anti-tumor activity.

9.2 Drug-Drug Interactions

The effects of other drugs on RETEVMO are listed in Table 7. The effects of RETEVMO on other drugs are listed in Table 8. The drugs listed in these tables are based on either drug interaction case reports or studies, or potential interactions due to the expected magnitude and seriousness of the interaction. This list is not exhaustive.

<td>Avoid coadministration of RETEVMO with sensitive CYP2C8 substrates. If coadministration cannot be avoided, modify the substrate dosage as recommended in its product labeling.</td>
</tr>
</tbody>
</table>

| **Effect of selpercatinib on sensitive CYP3A4 substrates** | | | |
| Sensitive CYP3A4 substrates, including but not limited to midazolam, alfentanil, avanafil, buspirone, darifenacin, darunavir, everolimus, lomitapide, ibrutinib, lovastatin, naloxegol, simvastatin, tipranavir, triazolam, vardenafil | CT, T | Coadministration of multiple doses of RETEVMO (160 mg BID) with midazolam (2 mg QD) increased the midazolam AUC$_{0\text{-INF}}$ by 54% and C$_{\text{max}}$ by 39%. | Avoid coadministration of RETEVMO with sensitive CYP3A4 substrates. If coadministration cannot be avoided, modify the substrate dosage as recommended in its product labeling. |

| **Effect of selpercatinib on transporters** | | | |
| MATE1 substrates, including but not limited to creatinine | T | Selpercatinib inhibits the renal transporter multidrug and toxin extrusion protein 1 (MATE1). | Selpercatinib may increase serum creatinine by decreasing renal tubular secretion of creatinine via inhibition of MATE1. Consider alternative markers of renal function if persistent elevations in serum creatinine are observed, such as cystatin C, BUN, or calculated GFR. No clinically significant differences in glucose levels were observed when metformin (MATE1 substrate) was coadministered with selpercatinib. |

Legend: CT=Clinical Trial; T=Theoretical
**P-glycoprotein (P-gp) Inhibitors:** Coadministration of single dose of RETEVMO (160 mg QD) with single dose of rifampin (P-gp inhibitor, 600 mg QD) increased the selpercatinib AUC0-INF by 6% and Cmax by 19% and is not clinically significant.

**In vitro drug interactions:** In vitro, selpercatinib does not inhibit or induce CYP1A2, CYP2B6, CYP2C9, CYP2C19, or CYP2D6 at clinically relevant concentrations. Selpercatinib is not a substrate for transporters OAT1, OAT3, OCT1, OCT2, OATP1B1, OATP1B3, MATE1, or MATE2-K.

**Other QTc Interval-Prolonging Drugs**
The concomitant administration of RETEVMO with other drugs known to prolong the QTc interval or induce torsade de pointes should be avoided. Current information sources should be consulted for lists of drugs that prolong the QTc interval.

When it is not feasible to avoid concomitant use of drugs known to prolong the QTc interval, obtain ECGs and serum electrolytes measurements prior to and after initiation of any drug known to prolong the QTc interval. Perform more frequent ECG monitoring as clinically indicated during treatment.

**Drugs that Affect Electrolytes**
Use of RETEVMO with drugs that can decrease electrolyte levels should be avoided to the extent possible as this may increase the risk of QTc interval prolongation. Such drugs include, but are not limited to, the following: loop diuretics, thiazide and related diuretics, laxatives, enemas, amphotericin B, high-dose corticosteroids, and proton pump inhibitors.

**Drugs that Reduce Heart Rate**
Avoid using RETEVMO concomitantly with drugs that reduce heart rate, including, but not limited to, beta-blockers, digitalis glycosides, non-dihydropyridine calcium channel blockers, cholinesterase inhibitors, alpha2-adrenoceptor agonists, L- inhibitors, and sphingosine-1 phosphate receptor modulators.

### 9.3 Drug-Food Interactions

RETEVMO may be administered with or without food unless coadministered with a proton pump inhibitor (see DOSAGE AND ADMINISTRATION and ACTION AND CLINICAL PHARMACOLOGY - Pharmacokinetics - Absorption). Grapefruit can inhibit cytochrome P450 CYP3A enzymes and potential drug interactions of grapefruit and grapefruit containing products with RETEVMO cannot be ruled out.

### 9.4 Drug-Herb Interactions

St. John’s Wort (hypericum perforatum) is a strong CYP3A inducer. Co-administration of St. John’s Wort with RETEVMO should be avoided.

### 9.5 Drug–Laboratory Test Interactions

RETEVMO may increase serum creatinine by decreasing renal tubular secretion of creatinine via inhibition of MATE1, without affecting glomerular function. In healthy subjects administered RETEVMO 160 mg orally twice daily, serum creatinine increased 18% after 10 days. If persistent elevations in serum creatinine are observed, alternative markers of renal function should be considered, such as cystatin C, blood urea nitrogen (BUN), or calculated glomerular filtration rate (GFR).
10 ACTION AND CLINICAL PHARMACOLOGY

10.1 Mechanism of Action

Selpercatinib is an orally available, small molecule kinase inhibitor. In enzyme assays, selpercatinib inhibited the “rearranged during transfection” (RET) receptor tyrosine kinase, VEGFR3 (FLT4) and VEGFR1 (FLT1) kinases with IC\textsubscript{50} values ranging from 0.92 nM to 67.6 nM. Selpercatinib also inhibited FGFR1, 2 and 3 at higher concentrations. In cellular assays, selpercatinib inhibited RET at an IC\textsubscript{50} approximately 60-fold lower than the IC\textsubscript{50} for FGFR1 and 2 and approximately 8-fold lower than the IC\textsubscript{50} for VEGFR3. In radioligand binding assays at a concentration of 1µM, selpercatinib inhibited the 5-HT transporter (70.2%) and the α2C receptor (51.7%).

Chromosomal rearrangements involving in-frame fusions of RET with various partners can result in constitutively activated chimeric RET fusion proteins that can act as oncogenic drivers, promoting cell proliferation and survival in tumor cell lines. Point mutations in RET can also result in constitutively activated RET proteins that can promote cell growth and survival in tumor cell lines.

In RET enzyme assays, selpercatinib inhibits the kinase activity of wild type RET and multiple mutated forms of RET (RET-V804L, RET-V804M, RET-A883F, RET-S904F, and RET-M918T) with IC\textsubscript{50} values of 0.20 nM to 2.21 nM.

Selpercatinib demonstrated in vitro inhibition of human cancer cell lines derived from multiple tumor types harboring RET fusion genes and RET mutations with EC\textsubscript{50} values equal to 10 nM or less. In in vivo mouse studies, selpercatinib demonstrated inhibition of tumor growth in RET fusion and RET mutant cancer cell lines, patient-derived RET fusion xenograft models, and a patient-derived RET fusion xenograft model harboring a RET V804M mutation. Selpercatinib also exhibited intracranial anti-tumor activity of patient-derived RET fusion xenograft tumors implanted directly into the brain of mice.

10.2 Pharmacodynamics

Cardiac Electrophysiology

In a randomised, double-blind, placebo- and positive controlled, 4-way crossover ECG assessment study in 32 healthy subjects, selpercatinib at single supratherapeutic doses of 320 mg and 640 mg was associated with a concentration-dependent prolongation of the QTcF interval (QTcF=QT/RR\textsuperscript{0.33}). The maximum difference from placebo in mean change from baseline QTcF was 8.1 ms (90% CI 4.3, 11.9) at 12 h post-dosing in the 320 mg arm and 9.7 ms (90% CI 7.0, 12.5) at 2.5 h post-dosing in the 640 mg treatment arm. The mean Cmax values were 2024 ng/mL and 2356 ng/mL after the single 320 mg and 640 mg doses, respectively.

According to a pharmacokinetic-pharmacodynamic model, the predicted magnitude of QTcF prolongation is 10.7 ms (90% CI 9.3, 12.2) at the mean steady-state Cmax value of 2980 ng/mL reported for the 160 mg twice-daily therapeutic dose administered for 8 days to cancer patients and 16.8 ms (90% CI 14.4, 19.2) at the mean steady-state Cmax value of 4574 ng/mL reported for the 160 mg twice-daily dose administered for 9 days to healthy subjects.

On day 8 of treatment in cancer patients (N=564) initiated at the 160 mg twice-daily dose of RETEVMO in the uncontrolled LIBRETTO-001 trial, the mean change from baseline QTcF was 22.4 ms (95% CI 20.6, 24.2) at 2 h post-dosing.
10.3 Pharmacokinetics

The pharmacokinetics of selpercatinib were evaluated in patients with locally advanced or metastatic solid tumors administered 160 mg twice daily unless otherwise specified. Steady-state selpercatinib AUC and $C_{\text{max}}$ increased in a slightly greater than dose proportional manner over the dose range of 20 mg once daily to 240 mg twice daily (0.06 to 1.5 times the maximum recommended total daily dosage).

Steady-state was reached by approximately 7 days and the median accumulation ratio after administration of 160 mg twice daily was 3.4-fold for AUC and 2.66 for $C_{\text{max}}$. Mean steady-state selpercatinib $C_{\text{max}}$ was 2,980 ng/mL, AUC$_{0-24\text{h}}$ was 51,600 ng*h/mL, $t^{1/2}$ was 24.5 hours and CLss/F was 6 L/hr after administration of selpercatinib 160 mg BID in cancer patients (Table 9). The pharmacokinetics of selpercatinib were comparable between cancer patients and healthy volunteers.

</tbody>
</table>
|                      | CV% = coefficient of variation

Absorption: After an oral dose of 160 mg in adult patients and in healthy subjects, selpercatinib was rapidly absorbed, with $T_{\text{max}}$ of approximately 2 hours. Geometric mean absolute oral bioavailability in healthy subjects was 73.2%.

Effect of food: Compared to selpercatinib AUC$_{\text{f}}$, $C_{\text{max}}$ and $T_{\text{max}}$ in the fasted state, selpercatinib AUC$_{\text{f}}$ was increased by 9% and $C_{\text{max}}$ was reduced by 14% and $T_{\text{max}}$ was delayed from 1.5 hours to 4.0 hours after oral administration of a single 160 mg dose (2 x 80 mg) to healthy subjects taken with a high-fat, high calorie meal.

Distribution: The apparent volume of distribution (Vss/F) of selpercatinib is 191 L. Protein binding of selpercatinib is 97% in vitro and is independent of concentration. The blood-to-plasma concentration ratio is 0.7.

Metabolism: Selpercatinib is metabolized predominantly by CYP3A4. Following oral administration of a single [¹⁴C] radiolabeled 160 mg dose of selpercatinib to healthy subjects, unchanged selpercatinib constituted 86% of the radioactive drug components in plasma.

Elimination: Following oral administration of a single [¹⁴C] radiolabeled 160 mg dose of selpercatinib to healthy subjects, 69% of the administered radioactivity was recovered in feces and 24% was recovered in urine.

Special Populations and Conditions

Pediatrics (<18 years of age): Very limited pharmacokinetics data are available for patients 15 to 17 years of age. There are no data on the pharmacokinetics of selpercatinib in pediatric patients younger than 15 years of age.

Geriatrics (≥65 years of age): Based on a population pharmacokinetic analysis of the LIBRETTO-001 study, the pharmacokinetics of selpercatinib in patients ≥65 years of age were comparable to patients between 18 years to 65 years.
Patients with body weight <50 kg: The apparent volume of distribution and clearance of selpercatinib increase with increasing body weight (27 kg to 177 kg). In subjects <50 kg, the AUC$_{0-12}$ and the C$_{max}$ of selpercatinib were respectively approximately 50% and 70% higher than in subjects with bodyweights 70-80 kg. Dosing adjustment is required in subjects < 50 kg (see DOSAGE AND ADMINISTRATION).

Hepatic impairment: In subjects with mild or severe hepatic impairment according to the Child-Pugh classification, unbound AUC$_{inf}$ of selpercatinib increased approximately by 33%, and 228.4% respectively and unbound C$_{max}$ increased by approximately 78.2%, and 131.6% respectively, compared to subjects with normal hepatic function. No changes in unbound AUC$_{inf}$ and unbound C$_{max}$ were observed in subjects with moderate hepatic impairment. No dose adjustment is recommended for patients with mild or moderate hepatic impairment. Reduce the dose of RETEVMO in patients with severe hepatic impairment to 80 mg twice daily (see DOSAGE AND ADMINISTRATION and, WARNINGS AND PRECAUTIONS-Special Populations).

Renal impairment: In subjects with mild (eGFR: 60 – <90 ml/min/1.73m$^2$), moderate (eGFR: 30 – 59 ml/min/1.73m$^2$), or severe (eGFR: <30 ml/min/1.73m$^2$) renal impairment administered selpercatinib 160 mg QD, AUC$_{inf}$ of selpercatinib increased by approximately 21.7%, 50.1%, and 12.5% respectively in subjects with mild, moderate or severe renal impairment compared to subjects with normal renal function. C$_{max}$ of selpercatinib increased by 69%, 29.5% and decreased by 14.7% in subjects with mild, moderate or severe renal impairment compared to subjects with normal renal function. No dosage adjustment is necessary in patients with mild, moderate or severe renal impairment.

The effect of end-stage renal disease on the pharmacokinetics and safety of selpercatinib have not been evaluated. The use of selpercatinib in patients with end-stage renal disease is not recommended.

Race, gender: Based on a population pharmacokinetic analysis, race and sex had no clinically meaningful effect on the pharmacokinetics of selpercatinib.

11 STORAGE, STABILITY AND DISPOSAL

Store at room temperature (15° to 30°C).
PART II: SCIENTIFIC INFORMATION

RETEVMO™, indicated as monotherapy for the treatment of:

- metastatic RET fusion-positive non-small cell lung cancer (NSCLC) in adult patients,
- RET-mutant medullary thyroid cancer in adult and pediatric patients 12 years of age and older with unresectable advanced or metastatic disease,
- RET fusion-positive differentiated thyroid carcinoma in adult patients with advanced or metastatic disease (not amenable to surgery or radioactive iodine therapy) following prior treatment with sorafenib and/or lenvatinib.

has been issued marketing authorization with conditions, pending the results of trials to verify its clinical benefit. Patients should be advised of the nature of the authorization. For further information for RETEVMO please refer to Health Canada’s Notice of Compliance with conditions - drug products web site (https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/notice-compliance/conditions.html).

12 PHARMACEUTICAL INFORMATION

Drug Substance

Proper/Common name: selpercatinib

Chemical name: 6-(2-hydroxy-2-methylpropoxy)-4-(6-((6-methoxypyridin-3-yl)methyl)-3,6-diazabicyclo[3.1.1]heptan-3-yl)pyridin-3-yl)pyrazolo[1,5-a]pyridine-3-carbonitrile

Molecular formula and molecular mass: C_{29}H_{31}N_{7}O_{3}; formula weight of 525.6 g/mol

Structural formula:

![Structural formula of selpercatinib](image)

Physicochemical properties: Selpercatinib is an anhydrous, crystalline (Form A), white to practically white to light yellow powder. The aqueous solubility of selpercatinib is pH dependent, from sparingly soluble at low pH (≥10 mg/mL at pH 1.3) to practically insoluble at neutral pH (0.002 mg/mL at pH 7.5).

13. CLINICAL TRIALS

13.1 Trial Design and Study Demographics

The efficacy of RETEVMO in patients with advanced RET fusion-positive NSCLC, RET-mutant MTC, and RET fusion-positive thyroid cancer was evaluated in a phase 1/2, multicenter, open-label, multi-cohort clinical trial (LIBRETTO-001; see Tables 10, 11, and 12, respectively). Identification of a RET gene alteration was prospectively determined in local laboratories using next generation sequencing (NGS), polymerase chain reaction (PCR), or fluorescence in situ
hybridization (FISH). Among RET fusion-positive NSCLC patients, the most common fusion partner was KIF5B, followed by CCDC6 and then NCOA4. Among RET-mutant MTC patients, the most common mutation was M918T, followed by extracellular cysteine mutation. For patients with RET fusion-positive thyroid cancers, CCDC6 was the most common fusion partner. The major efficacy outcome measures were overall response rate (ORR) and duration of response (DOR), as determined by an independent review committee (IRC) according to RECIST v1.1.

Table 10 - Summary of Patient Demographics for Clinical Trials in RET Fusion-Positive NSCLC

</tr>
</tbody>
</table>

In patients with RET fusion-positive NSCLC who were previously treated with platinum-based chemotherapy, 52% were White, 38% were Asian, 4.8% were Black, and 3.8% were Hispanic/Latino. ECOG performance status was 0-1 (98%) or 2 (2%), and 98% of patients had metastatic disease. Patients received a median of 3 prior systemic therapies (range: 1-15), and 58 patients had prior anti-PD-1/PD-L1 therapy. At initial diagnosis, the majority of patients (87.6%) were diagnosed with nonsquamous NSCLC; one patient (1%) had squamous cell NSCLC; and the histology was unknown in 11.4% of patients. RET fusions were detected in 89.6% of patients using NGS (81.0% tumor samples, 8.6% blood or plasma samples); 8.6% using FISH; and 1.9% using PCR.

In patients with RET fusion-positive NSCLC who were treatment-naïve, 72% were White, 18% were Asian, and 8% were Black. ECOG performance status was 0-1 in all patients (100%) and all patients had metastatic disease. RET fusions were detected in 92.3% of patients using NGS (64.1% tumor samples, 28.2% blood or plasma samples); and 7.7% using FISH.

</tbody>
</table>

In patients with RET-mutant MTC who were previously treated with vandetanib (76.4% of patients) or cabozantinib (67.3% of patients), 89% were White, 7% were Hispanic/Latino, and 1.8% were Black. One pediatric patient was included (17 years of age). ECOG performance status was 0-1 (95%) or 2 (5%), and 98% of patients had metastatic disease. Patients received a median of 2 prior systemic therapies (range: 1-8). RET mutation status was detected in 82% of patients using NGS (78% tumor samples; 4% blood or plasma), 16% using PCR, and 2% using an unknown test. The protocol excluded patients with synonymous, frameshift, or nonsense RET mutations.

In patients with RET-mutant MTC who were vandetanib and cabozantinib treatment-naïve, 86% were White, 4.5% were Asian, and 2.3% were Hispanic/Latino. Two pediatric patients were included (ages 15 years and 16 years). ECOG performance status was 0-1 (97%) or 2 (3%). All patients (100%) had metastatic disease, and 18% had received 1 or 2 prior systemic therapies (including 8% kinase inhibitors, 3.4% chemotherapy, 2.3% anti-PD1/PD-L1 therapy, and 1.1% radioactive iodine). RET mutation status was detected in 77.3% of patients using NGS (75% tumor samples, 2.3% blood samples); 18.2% using PCR; and 4.5% using an unknown test.

</tbody>
</table>
In patients with RET fusion-positive thyroid cancer, 74% were White, 11% were Hispanic/Latino, 7.4% were Asian, and 3.7% were Black. ECOG performance status was 0-1 (89%) or 2 (11%). All (100%) patients had metastatic disease with primary tumor histologies including papillary thyroid cancer (21 patients; 78%), poorly differentiated thyroid cancer (3 patients), anaplastic thyroid cancer (2 patients), or Hurthle cell thyroid cancer (1 patient). Patients were radioactive iodine (RAI)–refractory (if RAI was an appropriate treatment option) and had received a median of 3 prior therapies (range: 1-7). RET fusion-positive status was detected in 93% of patients using NGS tumor samples and in 7% using blood samples. Efficacy was evaluated in a cohort of patients (n=19) who were RAI-refractory and who had received sorafenib, lenvatinib, or both.

13.2 Study Results

13.2.1 Metastatic RET Fusion-Positive Non-Small Cell Lung Cancer

Efficacy results for patients with RET fusion-positive NSCLC previously treated with platinum chemotherapy are summarized in Table 13. A waterfall plot illustrating the best change in tumor size per RECIST v1.1 and based on independent review committee assessment is shown in Figure 1.

Table 13 - Efficacy Results in Patients with Metastatic RET Fusion-Positive NSCLC Previously Treated with Platinum Chemotherapy - LIBRETTO-001

\(^a\) Confirmed overall response rate assessed by independent review committee. CI=confidence interval; NE=not estimable.

Figure 1 - Waterfall Plot of Best Change in Tumor Burden in Patients with Metastatic RET Fusion-Positive NSCLC Previously Treated with Platinum Chemotherapy – LIBRETTO-001

Based on independent review committee assessment
PD=progressive disease; SD=stable disease; PR=partial response; NE=not estimable; CR=complete response.
Note: Five patients not shown due to 2 patients having non-target lesions only, and 3 patients with no post-baseline target lesion measurement.

The efficacy of RETEVMO in patients with RET fusion-positive NSCLC of squamous histology has not been fully evaluated due to limited clinical data.

An exploratory subgroup analysis showed that, among the 58 patients who received an anti-PD-1 or anti-PD-L1 therapy, either sequentially or concurrently with platinum-based chemotherapy, the ORR was 66% (95% CI: 52%, 78%) and the median DOR was not reached (95% CI: 12.0, not estimable).

Among the 105 patients with RET fusion-positive NSCLC, 11 had measurable central nervous system metastases at baseline as assessed by IRC. No patient received radiation therapy to the brain within 2 months prior to study entry. Responses in intracranial lesions were observed in 10 of these 11 patients; the median duration of response for patients with measurable CNS disease at baseline was 10.1 months (95% CI: 6.7, NE).

Efficacy results for patients with treatment naïve RET fusion-positive NSCLC are summarized in Table 14. A waterfall plot illustrating the best change in tumor size per RECIST v1.1 and based on independent review committee assessment is shown in Figure 2.

14 NON-CLINICAL TOXICOLOGY

Repeat Dose Toxicology Studies

Repeat-dose studies were conducted in rats and minipigs to characterize toxicity. Target organs of toxicity common to the rat and minipig were hematopoietic system, lymphoid tissues, tongue, pancreas, epiphyseal growth plate, and male reproductive tissues. In general, toxicities in these organs were reversible; the exception was the testicular toxicity. Reversible toxicity was observed in the ovaries and gastrointestinal tract in minipigs only; at high doses, gastrointestinal toxicity caused morbidity at exposures in minipigs that were generally lower than exposures determined in humans at the recommended dose. In one minipig study, females exhibited a slight, reversible increase in QTc prolongation of approximately 12% compared to controls and 7% compared to pre-dose values. Target organs of toxicity observed only in rats were incisor tooth, liver, vagina, lungs, Brunner's gland, and multi-tissue mineralization associated with hyperphosphatemia. These toxicities only occurring in these organs in rats were reversible.

In 4-week general toxicology studies in rats, animals showed signs of physeal hypertrophy and tooth dysplasia at doses resulting in exposures ≥ approximately 3 times the human exposure at the 160 mg twice daily clinical dose. Minipigs also showed signs of minimal to marked increases in physeal thickness at the 15 mg/kg high dose level (approximately 0.3 times the human exposure at the 160 mg twice daily clinical dose). Rats in both the 4- and 13-week toxicology studies had malocclusion and tooth discoloration at the high dose levels (≥1.5 times the human exposure at the 160 mg twice daily clinical dose) that persisted during the recovery period.

Genotoxicity and Carcinogenicity

Carcinogenicity studies have not been conducted with selpercatinib.

Selpercatinib was not mutagenic in the in vitro bacterial reverse mutation (Ames) assays, with or without metabolic activation, or clastogenic in the in vitro micronucleus assay in human peripheral lymphocytes, with or without metabolic activation. Selpercatinib was positive in the in vivo micronucleus assay in rats at concentrations >7 times the C_max at the human dose of
160 mg twice daily.

**Reproductive Toxicology**

In general toxicology studies, male rats and minipigs exhibited testicular degeneration that was associated with luminal cell debris and/or reduced luminal sperm in the epididymis at selpercatinib exposures approximately 0.4 (rat) and 0.1 (minipig) times the clinical exposure by AUC at the recommended human dose of 160 mg twice daily. In a dedicated fertility study in male rats, administration of selpercatinib at doses up to 30 mg/kg/day (approximately twice the clinical exposure by AUC at the 160 twice-daily dose) for 28 days prior to cohabitation with untreated females did not affect mating or have clear effects on fertility. Males did, however, display a dose-dependent increase in testicular germ cell depletion and spermatid retention at doses ≥3 mg/kg (~0.2 times the clinical exposure by AUC at the 160 twice-daily dose) accompanied by altered sperm morphology at 30 mg/kg.

In a dedicated fertility study in female rats treated with selpercatinib for 15 days before mating to Gestational Day 7, there were decreases in the number of estrous cycles at a dose of 75 mg/kg (approximately equal to the human exposure by AUC at the 160 mg twice-daily clinical dose). Although selpercatinib did not have clear effects on mating performance or ability to become pregnant at any dose level, half of females at the 75 mg/kg dose level had 100% nonviable embryos. At the same dose level in females with some viable embryos, there were increases in post-implantation loss.

Selpercatinib administration to pregnant rats during the period of organogenesis at oral doses ≥100 mg/kg [approximately 3.6 times the human exposure based on the area under the curve (AUC) at the clinical dose of 160 mg twice daily] resulted in 100% post-implantation loss. At the dose of 50 mg/kg [approximately equal to the human exposure (AUC) at the clinical dose of 160 mg twice daily], 6 of 8 females had 100% early resorptions; the remaining 2 females had high levels of early resorptions with only 3 viable fetuses across the 2 litters. All viable fetuses had decreased fetal body weight and malformations (2 with short tail and one with small snout and localized edema of the neck and thorax).

In the general toxicology study in minipigs, there were findings of decreased or absent corpora lutea at a selpercatinib dose of 15 mg/kg (approximately 0.3 times the human exposure by AUC at the 160 mg twice-daily clinical dose). Corpora luteal cysts were present in the minipig at selpercatinib doses ≥2 mg/kg (approximately 0.07 times the human exposure by AUC at the 160 mg twice-daily clinical dose).
RETEVMO™
Selpercatinib capsules

Read this carefully before you start taking RETEVMO and each time you get a refill. This leaflet is a summary and will not tell you everything about this drug. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about RETEVMO.

What is RETEVMO used for?
See the following boxed text:

For the following indications, RETEVMO has been approved with conditions (NOC/c). This means it has passed Health Canada’s review and can be bought and sold in Canada, but the manufacturer has agreed to complete more studies to make sure the drug works the way it should. For more information, talk to your healthcare professional.

RETEVMO is used to treat certain cancers caused by abnormal RET genes in:

- adults with a type of lung cancer called non-small cell lung cancer (NSCLC). It is used when your cancer has spread to other parts of your body.
- adults and children 12 to 17 years old with medullary thyroid cancer. It is used when:
  - your cancer is advanced or has spread to other parts of your body, and
  - your cancer cannot be removed using surgery
- adults with differentiated thyroid cancer. It is used when:
  - your cancer is advanced or has spread to other parts of your body,
  - your cancer cannot be removed using surgery,
  - radioactive iodine therapy did not work, is no longer working or is not appropriate, and
  - you have tried treatment with sorafenib and/or lenvatinib

Your healthcare professional will perform a test to make sure that RETEVMO is right for you.

What is a Notice of Compliance with Conditions (NOC/c)?
A Notice of Compliance with Conditions (NOC/c) is a type of approval to sell a drug in Canada.
Health Canada only gives an NOC/c to a drug that treats, prevents, or helps identify a serious or life-threatening illness. The drug must show promising proof that it works well, is of high quality, and is reasonably safe. Also, the drug must either respond to a serious medical need in Canada or be much safer than existing treatments.

Drug makers must agree in writing to clearly state on the label that the drug was given an NOC/c, to complete more testing to make sure the drug works the way it should, to actively monitor the drug’s performance after it has been sold, and to report their findings to Health Canada.

### Serious Warnings and Precautions

- Only a doctor who has experience treating cancer should treat you with this drug.
- RETEVMO can harm your unborn baby.
- RETEVMO can cause serious side effects including:
  - **Hemorrhage** (severe bleeding; blood loss): Bleeding can occur with RETEVMO treatment and can be serious. It may even cause death. If you experience bleeding, your doctor may stop your treatment.
  - **Liver problems**: Liver problems and increased liver enzymes are very common with RETEVMO and may sometimes be serious. Your healthcare professional will run blood tests to check your liver before and during treatment.
  - **Allergic reactions**: RETEVMO may cause a fever, rash, muscle or joint pain. This is common in the first month of treatment. If you experience an allergic reaction, your doctor may prescribe medicine to treat your reaction.
  - **Hypertension** (high blood pressure): High blood pressure is very common with RETEVMO and may sometimes be serious. Your blood pressure should be well controlled before you start taking RETEVMO. Your healthcare professional should check your blood pressure regularly when you take RETEVMO. If blood pressure becomes a problem, your doctor may prescribe medicine to treat your high blood pressure.
  - **QT prolongation** (a heart rhythm condition): Changes to your heart rhythm can occur with RETEVMO treatment and can be serious. Your healthcare professional will check that your heart is working properly before and during your treatment.

See the Serious side effects and what to do about them table, below, for more information on these serious side effects.

### How does RETEVMO work?

RETEVMO works by blocking the action of RET protein kinase. Specific RET altered proteins can lead to uncontrolled cell growth and cancer. RETEVMO stops specific RET altered proteins from working. RETEVMO may slow or stop the cancer from growing. It may also help to shrink the cancer.
What are the ingredients in RETEVMO?

Medicinal ingredients: selpercatinib

Non-medicinal ingredients: Black iron oxide, colloidal silicon dioxide, FD & C Blue No. 1 (80 mg capsule only), gelatin, microcrystalline cellulose, pharmaceutical grade printing ink, titanium dioxide

RETEVMO comes in the following dosage forms:

Capsule: 40 mg and 80 mg

Do not use RETEVMO if:

- You are allergic to selpercatinib or any of the other ingredients in this medicine.

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take RETEVMO. Talk about any health conditions or problems you may have, including if you have:

- heart problems or have a family history of heart problems, including a condition known as QT prolongation. QT prolongation happens when there are changes in the electrical activity of the heart. This can cause heart rhythm problems.
- high blood pressure
- liver problems
- kidney problems
- diabetes
- a recent history of significant bleeding
- a history of stroke or brain injury
- a history of anorexia or other eating disorder
- persistent vomiting
- been told that you have an imbalance of electrolytes in your blood, such as potassium, magnesium or calcium
- a condition called “autonomic neuropathy” that causes problems with blood pressure, heart rate, sweating, bowel and bladder control and digestion

Other warnings you should know about:

Risk of wound healing problems: Wounds may not heal properly during treatment with RETEVMO. Tell your healthcare professional if you plan to have any surgery before or during treatment with RETEVMO.

- You should stop taking RETEVMO at least 7 days before planned surgery.
- Your healthcare professional should tell you when you may start taking RETEVMO again after surgery.

Tumor lysis syndrome: RETEVMO can cause a serious side effect known as Tumor lysis syndrome (TLS). TLS is caused by a sudden, rapid death or breakdown of cancer cells due to treatment. TLS is a condition that can cause kidney failure and abnormal heart rhythm. You may be at risk of TLS if you have:
- Tumors that are growing quickly,
- Many or large tumours,
- Problems with your kidneys or
- You do not have enough water or fluids in your body.

Your healthcare professional will check you for signs and symptoms of TLS. Drink plenty of water when taking RETEVMO to stay well hydrated.

**Pregnancy and breastfeeding:**

**Female patients:**
- If you are pregnant, able to get pregnant or think you are pregnant, there are specific risks you should discuss with your healthcare professional.
- You should not take RETEVMO if you are pregnant. It can harm your unborn baby.
- If you are able to become pregnant:
  - Your healthcare professional will do a pregnancy test before you start RETEVMO. This test must show that you are not pregnant.
  - Avoid becoming pregnant while you are taking RETEVMO. Use highly effective birth control during treatment and for at least 2 weeks after your last dose. Talk to your healthcare professional about birth control methods that may be right for you during this time.
  - Tell your healthcare professional right away if you become pregnant or think you are pregnant during treatment with RETEVMO.
  - If you are breastfeeding or planning to breastfeed: it is not known if RETEVMO passes into breast milk. Do not breastfeed during treatment with RETEVMO and for at least 2 weeks after your final dose. Talk to your healthcare professional about the best way to feed your baby during this time.

**Male patients with female partners who are able to become pregnant:**
- Use highly effective birth control while you are on RETEVMO and for at least 2 weeks after your last dose.
- If during your treatment with RETEVMO, your sexual partner becomes pregnant or thinks she may be pregnant, tell your healthcare professional right away.

**Fertility:** Taking RETEVMO may affect fertility in males and females. This means that it may be difficult for you to have a child. Talk to your healthcare professional if you have questions about this.

**Driving and Using Machines:** Fatigue and dizziness can occur with RETEVMO. Be cautious after taking RETEVMO to see how you feel before driving a vehicle or using machinery.

**Children and adolescents:**
- RETEVMO is not approved for the treatment of lung cancer or thyroid cancer other than medullary thyroid cancer in patients under 18 years of age.
- For the treatment of medullary thyroid cancer, RETEVMO is not approved for use in children under 12 years of age.
• Taking RETEVMO may cause slowed growth in children 12 to 17 years of age.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with RETEVMO:

• Alfentanil – used to treat pain
• Amphotericin B – used to treat fungal infections
• Avanafil – used to treat erectile dysfunction
• Bosentan, diltiazem, verapamil – used to treat high blood pressure and heart arrhythmias
• Buprenorphine – used to treat pain and help people stop taking pain medication
• Bupropion – used to treat depression and to help people stop smoking
• Buspirone – used to treat anxiety
• Carbamazepine – used to treat seizures, nerve pain, and sometimes used to treat bipolar disorders
• Ciprofloxacin, clarithromycin – used to treat bacterial infections
• Conivaptan – used to treat low sodium levels in the blood
• Darifenacin – used to treat a frequent need to urinate
• Darunavir, efavirenz, ritonavir, tipranavir – used to treat human immunodeficiency virus (HIV) infection
• Dexamethasone and other corticosteroids – used to treat asthma, severe allergies, certain lung diseases, a number of skin diseases, brain and eye swelling, and certain forms of arthritis. Dexamethasone may also be used to treat certain types of cancers.
• Dexlansoprazole, esomeprazole, lansoprazole, omeprazole, rabeprazole, cimetidine, famotidine, nizatidine, aluminum hydroxide gel, subsalicylate, calcium carbonate, magnesium hydroxide, ranitidine – used to treat too much stomach acid
• Enzalutamide – used to treat prostate cancer
• Everolimus – used to treat cancer
• Fluconazole, itraconazole, ketoconazole, miconazole, posaconazole, voriconazole, rifampin, rifabutin – used to treat fungal and bacterial infections
• Ibrutinib – used to treat cancer
• Lomitapide, lovastatin, simvastatin – used to treat high cholesterol
• Midazolam – used for sedation and to treat anxiety
• Montelukast – used to treat asthma
• Naloxegol – used to treat constipation caused by some pain medications
• Paclitaxel – used to treat a number of different cancers
- Phenobarbital, phenytoin – used to prevent and control seizures
- Repaglinide, rosiglitazone, pioglitazone – used to treat diabetes
- Sorafenib – used to treat cancer
- Selexipag – used to treat pulmonary arterial hypertension
- St. John’s Wort – an herbal medicine used to treat depression
- Telithromycin – used to treat certain types of bacterial infection
- Triazolam – used to help with sleeping
- Vardenafil – used to treat erectile dysfunction
- Medicines that cause heart rhythm conditions, including QT prolongation or torsade de pointes
- Medicines that cause a decrease in electrolyte levels. This includes:
  - diuretics (used to remove water from the body)
  - laxatives (used to loosen stools and increase bowel movements)
  - enemas (used to empty the bowels)
- Medicines that cause a decrease in heart rate. This includes:
  - beta-blockers (used to lower blood pressure)
  - digitalis glycosides (such as digoxin; used to treat congestive heart failure and abnormal heart rhythms)
  - calcium channel blockers (such as diltiazem and verapamil; used to lower blood pressure)
  - cholinesterase inhibitors (used to treat Alzheimer’s and dementia symptoms)
  - alpha2-adrenoceptor agonists (used to treat high blood pressure, irregular heart rate, sedation, and the inability to feel pain)
  - Inhibitors (used to treat heart failure)
  - sphingosine-1 phosphate receptor modulators (used to treat multiple sclerosis)
- Products with grapefruit

Ask your doctor or pharmacist if you are not sure whether your medicine is one of the medicines listed above.

**How to take RETEVMO:**

- Take exactly as prescribed for you by your doctor. Do not change your dose or stop taking RETEVMO unless your doctor tells you to. Check with your doctor or pharmacist if you are not sure.
- RETEVMO is taken twice a day. Take at about the same time every day, about 12 hours apart.
- Swallow RETEVMO whole. Do not open, crush, or chew the capsule.
- Take with or without food, unless you are also taking a proton pump inhibitor (see next
bullet point).

- During treatment with RETEVMO, you should avoid taking medicines to treat stomach-acid issues called proton pump inhibitors, H2 blockers and antacids. These medicines can affect how RETEVMO works. If this cannot be avoided and you need to take:
  - a proton pump inhibitor (such as dexlansoprazole, esomeprazole, lansoprazole, omeprazole, pantoprazole sodium, and rabeprazole): then, take RETEVMO with food.
  - an H2 blocker (such as famotidine, nizatidine, and cimetidine): then, take RETEVMO 2 hours before or 10 hours after the H2 blocker.
  - an antacid (such as calcium carbonate, magnesium hydroxide, and simethicone): then, take RETEVMO 2 hours before or 2 hours after taking the antacid.

**Usual dose:**
The usual dose depends on your body weight. Your doctor will determine the right dose for you.

- For patients weighing less than 50 kg, the usual dose is: 120 mg twice a day. This is a total daily dose of 240 mg.
- For patients weighing 50 kg or greater, the usual dose is: 160 mg twice a day. This is a total dose of 320 mg.

Your doctor may interrupt, change, or stop your dose. This may occur:

- based on your current health,
- if you take certain other medications,
- if your disease gets worse,
- if you develop certain side effects, or
- you are having surgery.

**Overdose:**

If you think you have taken too much RETEVMO, contact your healthcare professional, hospital emergency department or regional poison control centre immediately, even if there are no symptoms.

**Missed Dose:**

- If you miss a dose and it is more than 6 hours until your next scheduled dose, take the missed dose as soon as you remember. Then continue with your next dose at your regular time.
- If it is within 6 hours of your next dose, skip the missed dose. Wait and take your next dose at your scheduled time. Do not take an extra dose.
- If you vomit after taking a dose, do not take an extra dose. Take your next dose at your regular time.

**What are possible side effects from using RETEVMO?**

These are not all the possible side effects you may feel when taking RETEVMO. If you
experience any side effects not listed here, contact your healthcare professional.

- Dry mouth, diarrhea, constipation, nausea, abdominal pain, vomiting
- Swelling in the stomach, arms, legs, hands, feet, eyes, face or other parts of your body
- Difficulty emptying your bladder, involuntary leakage of urine
- Fatigue, tiredness
- Decreased appetite
- Body pain, bone pain
- Headache, dizziness, ringing in the ears
- Cough, difficulty swallowing, shortness of breath
- Runny and stuffed nose, itchy eyes, sneezing, flushed and hot skin
- Skin rash, dry skin, skin sores or open wounds
- Confusion
- Erectile dysfunction
- Muscle pain, stiffness, weakness, cramps
- Feeling anxious, sad mood, difficulty sleeping, decreased sexual desire

RETEVMO can cause abnormal ECG and blood test results. ECG stands for electrocardiogram. Your doctor will do some tests before and during your treatment. These include checking for heart and liver problems and electrolyte levels in your blood. The doctor will interpret the results. They will tell you if there are any abnormalities in your tests that might need treatment.

<tr>
<th>Serious side effects and what to do about them</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Symptom / effect</strong></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>VERY COMMON</strong></td>
</tr>
<tr>
<td><strong>Hypertension</strong> (high blood pressure): headache, nosebleeds, shortness of breath, dizziness, chest pain, confusion.</td>
</tr>
<tr>
<td><strong>Leukopenia, neutropenia, lymphopenia</strong> (low white blood cells): chills, fever, infection. fatigue, aches and pains, and flu-like symptoms.</td>
</tr>
<tr>
<td>Liver problems and increased liver enzymes: loss of appetite, feeling sick or being sick, yellow skin, itching or pain in your liver area, yellowing of your skin and/or the white part of your eyes (jaundice), dark “tea-colored” urine, sleepiness, bleeding or bruising, loss of appetite, nausea or vomiting, pain on the upper right side of stomach.</td>
</tr>
<tr>
<td>QT Prolongation (a heart rhythm condition): a change in the way your heart beats (palpitations), dizziness, shortness of breath, chest pain, fainting, loss of consciousness, seizures.</td>
</tr>
<tr>
<td>Thrombocytopenia (low blood platelets): bruising or bleeding for longer than usual if you hurt yourself, tiredness, weakness, vomiting blood or if your vomit looks like coffee grounds, pink or brown urine, red or black (looks like tar) stools, coughing up blood or blood clots, unusual bleeding or bruising of your skin, menstrual bleeding that is heavier than normal, unusual vaginal bleeding, nose bleeds that happen often, drowsiness or difficulty being awakened, confusion, headache, change in speech.</td>
</tr>
<tr>
<td>Urinary tract infections: pain or burning sensation when peeing, need to pee more often than usual, pee that looks cloudy, blood in pee, feeling hot and shivery, pain in the lower stomach and back.</td>
</tr>
<tr>
<td><strong>COMMON</strong></td>
</tr>
<tr>
<td>Allergic reactions: fever, rash, muscle or joint pain.</td>
</tr>
<tr>
<td>Anemia (low red blood cells): Being short of breath, feeling very tired, loss of energy, weakness, chest pain, headache, dizziness, feeling light-headed.</td>
</tr>
<tr>
<td>Eye problems: dry eye, eye swelling, blurry vision.</td>
</tr>
<tr>
<td>Heart problems, including:</td>
</tr>
<tr>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>• Chest discomfort or pain</td>
</tr>
<tr>
<td>• <strong>Cardiac arrhythmias/palpitations</strong>: fast, slow or irregular heartbeat, heart racing, skipping beats, shortness of breath, weakness, inability to exercise, fluid in the legs.</td>
</tr>
<tr>
<td>• <strong>Pericardial effusion</strong> (fluid around the heart): sharp, piercing chest pain over the centre or left side of the chest which is more intense when breathing in, shortness of breath, palpitations, fever, fatigue, weakness or feeling sick, cough, swelling in the abdomen or leg.</td>
</tr>
<tr>
<td>• <strong>Cardiac arrest</strong> (heart stops beating): sudden collapse, no pulse, no breathing, loss of consciousness.</td>
</tr>
</tbody>
</table>

| Hyperthyroidism (overactive thyroid gland): weight loss, rapid or irregular heartbeat, increased appetite, anxiety. |   |   |
| Hypothyroidism (underactive thyroid gland): fatigue, increased sensitivity to cold, constipation, dry skin, weight gain. |   |   |

| Infections, including of the eye, nose, tooth, mouth, sinuses, throat, lungs, air passages, skin, stomach, intestines, blood: Fever and chills, fast heartbeat, nausea and vomiting, diarrhea, fatigue or weakness, discolored skin, sweating, severe pain, cough, shortness of breath, sharp chest pain, and rapid breathing. |   |   |

| Nervous system disorders: amnesia, decreased attention, memory problems, decreased sense of taste, numbness, burning sensation, feeling light headed, fainting, seizure, tremor. |   |   |
| Respiratory (breathing) disorders, including:  
|------------------------------------------------|
| • **Pleural effusion** (fluid around your lungs)  
| • **Pneumonitis** (inflammation of the lung tissue)  
| • **Pulmonary embolism** (blood clot in the lungs)  
| • **Respiratory failure** (stop breathing)  
| Symptoms include: changes in your voice, shortness of breath, chest pain, nose bleed, coughing up blood, nasal congestion and dryness, cough, sore throat, pain in ear, runny nose, bluish color around skin of fingernails and lips. |

| Skin disorders: acne, hair loss, dry or flaky skin, itching, rash, reddening of the skin, extra sensitivity to the sun, excessive sweating, redness or swelling on the palms of the hands and soles of the feet. |

| LESS COMMON  
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Embolism</strong> (blockage in a blood vessel): Sudden shortness of breath, chest pain, coughing up blood, fainting, falling down, changes to your eyesight, numbness and tingling in your arms or legs, rapid breathing, rapid heart rate, muscle weakness.</td>
</tr>
</tbody>
</table>

| Gastrointestinal disorders: stomach pain, diarrhea often with blood, rectal bleeding and pain, weight loss, fatigue, nausea, vomiting, fever, difficulty swallowing, sore throat, cough, chest pain, pain in gums, mouth sores. |
Hemorrhage (severe bleeding; blood loss): very low blood pressure, rapid heart rate, cold clammy skin, weakened pulse, fatigue, tingling or numbness in arms or legs, changes to vision, changes to balance, fainting, sudden severe headache, difficulty speaking, nausea, vomiting.

Hypotension (low blood pressure): dizziness, fainting, light-headedness, blurred vision, nausea, vomiting, fatigue (may occur when you go from lying or sitting to standing up).

Kidney failure/Acute kidney injury: Pee less, swelling in your legs, ankles or feet, short of breath, chest pain, muscle cramps, confusion, nausea, weakness, skin rashes, irregular heartbeat.

Tumor lysis syndrome (the sudden, rapid death or breakdown of cancer cells due to treatment): nausea, shortness of breath, irregular heartbeat, heart rhythm disturbances, pee less, cloudy pee, muscle spasms or twitching, tiredness, joint pain, severe muscle weakness, seizures.

If you have a troublesome symptom or side effect that is not listed here or becomes bad enough to interfere with your daily activities, talk to your healthcare professional.
Reporting Side Effects

You can report any suspected side effects associated with the use of health products to Health Canada by:

- Visiting the Web page on Adverse Reaction Reporting (https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada.html) for information on how to report online, by mail or by fax; or
- Calling toll-free at 1-866-234-2345.

**NOTE:** Contact your health professional if you need information about how to manage your side effects. The Canada Vigilance Program does not provide medical advice.

Storage:

- Store RETEVMO at room temperature (15°C to 30°C).
- Do not use this medicine after the expiry date (EXP) shown on the bottle.
- Keep out of reach and sight of children.

If you want more information about RETEVMO:

- Talk to your healthcare professional.
- Find the full product monograph that is prepared for healthcare professionals and includes this Patient Medication Information by visiting the Health Canada website (https://www.canada.ca/en/health-canada/services/drugs-health-products/drug-products/drug-product-database.html); or by calling 1-888-545-5972.

RETEVMO is a trademark owned by or licensed to Eli Lilly and Company, its subsidiaries or affiliates.
